Since first liver transplantation (LT) in 2004, there has been notable achievement for LT in Vietnam society.

But, considering large number of patient with end-stage liver disease or liver cancer, it is hard to be satisfied that LT has been sufficiently advanced.

From 2004 to 2018 May, total LT of Vietnam society was around 100 cases.

From March 2017, Vinmec International Hospital in Hanoi established LT program collaborating with Korean team.

We reviewed initial experiences of Vinmec LT team and analyzed the results and outcomes of LT.

Between April 2017 and May 2018.

We retrospectively reviewed 18 patients who underwent LT at Vinmec International Hospital in Hanoi.

We could use the result of Pusan National University Yangsan Hospital (PNUYH) to analyze statistically.

KOREA data Based on PNUYH data

Between 2010 May and Dec 2016, 178 cases LDLT using right lobe.

In Vietnam, because of significant differences such as RLV ratio or HV type, we could choose donor graft more safely even if ERL.

The good collaboration with experienced Korean team might be helpful to set up successfully within short time.

To achieve more successful LT program in Vietnam, there should be needed to overcome socio-economic limitations and support the healthcare policy.
